

Tech stack

As of Sep 24, 2026

Java with Spring Boot and PostgreSQL is the strongest backend choice for Vienna. Java roughly ties Python in job ads there, and many of the Python ads are data or AI roles.

Pair it with Angular or React: Angular leads Vienna ads, React leads globally. The rest follows the global defaults: Docker, GitHub Actions, AWS or Azure, OpenTelemetry with Grafana, and Playwright.

The stack

One pick per layer, with alternatives only where they are genuinely interchangeable. Numbers in brackets are the checklist items each layer serves.

Layer	Pick	Equally valid	Why
Backend (2, 3)	Java + Spring Boot	C# + ASP.NET Core	Java leads Vienna web-backend ads and C# is second (chart below).
Frontend (4)	Angular or React	—	Angular leads Vienna ads, React leads globally (numbers below). Tie-breaker: Angular for banks, insurers and public sector; React for startups and remote roles.
Frontend build, React path (4)	Vite single-page app	Next.js	Next.js is widely used, but its satisfaction fell from 68% to 55% in State of JS 2025. A single-page app keeps the state work visible.

Layer	Pick	Equally valid	Why
Server state (4)	React: TanStack Query. Angular: built-in HTTP client with signals	Angular: NgRx	No demand data at this level; these are the widely used options.
Database (2)	PostgreSQL	—	Most admired and most wanted database in the 2025 Stack Overflow survey, for the third year running.
Cache, rate limits, queue counters (3, 5)	Redis	Valkey	Redis usage grew 8 points in 2025. Valkey is the BSD-licensed fork; Redis 8 has been tri-licensed, including AGPLv3, since May 2025.
Background jobs (3)	RabbitMQ	A database-backed job queue, or Amazon SQS	Reviewers expect a real, durable queue rather than an in-memory list. Broker vs. database is your decision D7.
Live updates (4)	Server-Sent Events or WebSockets	—	Your decision D4; Spring supports both.
Auth (1)	Spring Security	Keycloak as identity provider	Building on the framework shows more of item 1; Keycloak shows OpenID Connect integration.
Payments (3, 5)	Stripe in test mode	—	Test mode and signed webhooks out of the box.

Layer	Pick	Equally valid	Why
Email (3)	Any transactional email API, with Mailpit locally	—	A commodity; no demand signal.
File storage (5)	Amazon S3, or your cloud's equivalent	—	Locally, use an S3 emulator such as LocalStack or Garage. Skip MinIO: its community edition went into maintenance mode in December 2025.
Containers (6)	Docker + Docker Compose	—	Docker usage jumped 17 points to 71% in 2025, the largest gain of any technology in the survey.
CI/CD (6)	GitHub Actions	GitLab CI	GitHub Actions leads organizational use at 33%, ahead of Jenkins (28%) and GitLab CI (19%). GitLab CI also shows up in Vienna ads.
Hosting (6)	AWS	Azure	AWS leads global cloud spending and Azure is second (numbers below).
Infrastructure as code (6, optional)	Terraform	OpenTofu	Terraform appears in several Vienna cloud ads. OpenTofu is the MPL-licensed fork with the same language.

Layer	Pick	Equally valid	Why
Observability (6)	OpenTelemetry into Prometheus, Loki, Tempo and Grafana	Grafana Cloud instead of self-hosting	67% of organizations run Prometheus in production, and OpenTelemetry use is growing fastest.
Backend tests (8)	JUnit + Testcontainers	—	The standard pairing for Spring integration tests against a real database.
Frontend tests (8)	Vitest for React; what the Angular CLI sets up for Angular	—	Vitest's usage grew 14 points in State of JS 2025, tied for the largest gain.
End-to-end tests (8)	Playwright	—	Also grew 14 points in State of JS 2025, and it now leads Cypress in npm downloads.
Load tests (8)	k6	Gatling	No reliable demand data. k6 scripts are JavaScript; Gatling's can be Java.
Docs (7)	OpenAPI generated from code, Mermaid diagrams, Markdown decision records	—	All live in the repo, and Mermaid renders on GitHub.

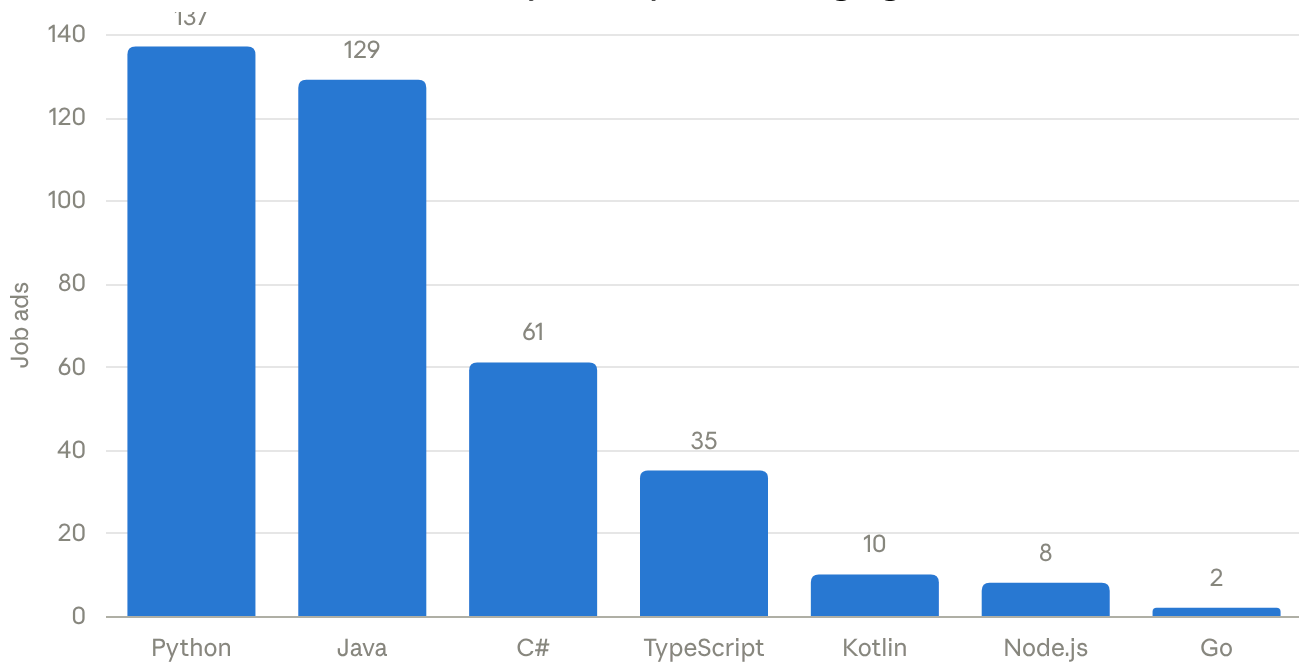

Confidence: about 70% on Java with Spring Boot. The alternative I rejected is TypeScript end to end with NestJS.

That path is one language across the stack and faster to build, but TypeScript and Node.js appear in far fewer Vienna ads. Flip to it if you'd rather aim at TypeScript-heavy roles.

Demand evidence

Java and Python lead Vienna's job ads by a wide margin. C# is a clear third, and TypeScript, Kotlin, Node.js and Go trail far behind.

Vienna job ads by backend language

karriere.at keyword counts, 24 Sep 2026

karriere.at, Vienna · 7 keyword searches, 24 Sep 2026

Counts are keyword searches on karriere.at for Vienna on 24 Sep 2026. One ad can name several languages, and Python's count includes data and AI roles.

On the same board, Angular appears in 48 ads, React in 32 and Vue in 12. Several ask for Java with Angular specifically, such as ÖBB's and p.how's full-stack roles.

Globally the order flips: 44.7% of developers used React in the 2025 Stack Overflow survey, against 18.2% for Angular.

AWS appears in 54 Vienna ads; I couldn't collect Azure's count this session. Globally AWS holds roughly 28–31% of cloud spending, Azure 20–25% and Google 12–15%, depending on the tracker.

Left out on purpose

These are in demand, but this project doesn't need them. Each makes a good rejected option in a decision record.

- **Kafka:** it appears in Vienna ads such as Wiener Wohnen's Kotlin, React and Kafka role, but event streaming solves a problem this project doesn't have (D7).
- **Kubernetes:** it shows up in several Vienna cloud and DevOps ads, such as Raiffeisen Digital Bank's and ADMIRAL's. One service on Docker Compose or a managed container service doesn't need an orchestrator, so treat it as a stretch goal at most.

- **Microservices:** start with one service unless your load test shows a bottleneck that splitting would fix (D7).
- **Python with FastAPI:** FastAPI had one of the biggest gains among web frameworks in the 2025 Stack Overflow survey. In Vienna, though, Python demand leans toward data and AI roles.
